PROVISIONAL INTERNAL DIAGNOSTIC — raw, no background subtraction, no C_rad, not Born level. Background source is a lowQ2-only 50% linearized proxy derived from a HISTORICAL Bprime sidecar (delta_BG = 0.5*B/Y), with no subtraction, shifted-response, or unfolding propagation. Cut-shift sources are one-sided ratio-based diagnostics. The eta-cut variation is deliberately EXCLUDED. Expanded total is NOT the final total. Values above 15% are clipped by the fixed axis; see the fullscale and autoscale variants.
